Calendar and Booking - Handoff

ft_transcendence - Team handoff - 8 November 2026

What changed

The booking work from mel-badd and ilallali was combined. The Prisma schema relations were repaired, and the backend builds. A valid user JWT is required for booking and calendar routes. Availability is scoped to the organization in the verified token.

Weekly rules and exceptions check that the agent belongs to the caller’s agency. Owners can manage their agency; other users can manage only themselves. Please confirm this role policy with the team.

Visits

POST /internal/ai/visits creates a visit only for an available property, agent, lead and matching contact in the same organization. It requires an existing AgentAvailability slot and a start time with timezone. It creates a status-history entry and sets the CRM lead to Visit Scheduled.

GET /internal/ai/visits lists visits in the caller’s organization without exposing user password or token fields. PATCH /internal/ai/visits/:id/reschedule and PATCH /internal/ai/visits/:id/cancel are available to the owner or assigned agent.

Booking and exception creation use a PostgreSQL advisory lock per agent and check overlaps. Competing requests through these code paths cannot both claim the same slot. Other writers must use the same locking approach or another shared conflict constraint.

Availability and exceptions

The requested day is interpreted in its timezone; overnight visits and exceptions are checked for overlap. Timezone calculations use @js-temporal/polyfill. Calendar exceptions store blocked intervals, using Africa/Casablanca for the calendar exception API.

Custom working-hour exceptions are rejected until the database and rules support them. Weekly rules are stored but do not yet create the AgentAvailability slots consumed by booking. The current availability lookup selects the first agency owner as agent; agree on the real assignment rule.

What was tested

On an isolated PostgreSQL database: JWT and cross-agency checks; weekly rules; creating and listing blocked intervals; timezone and overnight conflicts; two simultaneous booking requests (one success, one 409); lead update; list, reschedule, cancel, and safe user fields. The timezone unit tests pass.

Important remaining work: agree on AI service-to-service authentication; apply reviewed migrations to an existing database; connect weekly rules to slots; agree how cancellations affect CRM and notifications; test real agents and data.

Get the code

```
git switch main
git pull origin main
cd apps/backend
bun install --frozen-lockfile
bunx prisma generate
bun run build
```

Do not reset an existing database. Review and coordinate migrations with the team first.
