Property Backend - Handoff

ft_transcendence - Team handoff - 8 November 2026

What changed

The property controller now imports the NestJS Query, Patch and Delete decorators it uses. This fixes TypeScript build errors.

The Prisma property_matches model was restored after a merge removed it. It links a lead, a property and an organization. The VisitStatusHistory and other missing reverse relations were repaired so Prisma validates. A database migration is a separate step; restoring the schema text did not update a database.

Property test fixes

The controller test now supplies a mock PropertiesService and overrides the guards. The service test supplies a mock PrismaService. These are basic construction tests, not tests of real authentication, filtering or database behavior.

After the fixes, Prisma validation and the backend build passed. The full backend test command passed 3 suites and 5 tests in our environment.

What we tested before

With an isolated database and a test JWT, GET /properties returned a matching available villa with city, type, budget and bedroom filters. GET /properties/:id returned details, a cross-organization lookup returned 404, and a request without a token returned 401.

One edge case still needs attention: GET /properties?maxPrice=0 returned a property priced above zero because the service checks maxPrice as a truthy value. Check for undefined instead of truthiness when applying numeric filters.

AI integration

The AI client currently expects POST /internal/ai/properties/search with service credentials, while the current backend exposes JWT-protected GET /properties with query parameters and an array response. We need to agree whether to adapt the AI client or add an internal route, and how trusted agency context and service authentication work.

For customer recommendations, confirm that only available/published properties are returned and agree on images, fields, pagination and empty results. No real catalog integration has been tested through the AI yet.

Get the code

```
git switch main
git pull origin main
cd apps/backend
bun install --frozen-lockfile
bunx prisma generate
bun run build
npm run test -- --runInBand
```

Coordinate any migration for an existing database. Do not commit .env or share credentials.
